Emulsion Characteristic Analyser

Droplet sizes in emulsions

Migration- and stability analysis of high concentrated dispersphased emulsion and suspension with insitu sensors in lab and pilot plant

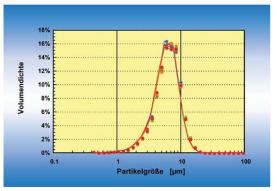

Emulsion Characteristic Analyser

Application:

ECA- Sensor allows measuring of size changing in original formulas of suspension and emulsion under insitu conditions with a minimum distance of 1μ sec between two droplets.

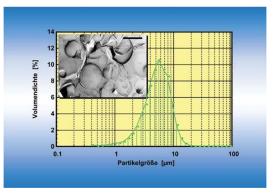

Therefore the formulation can be detected in streaming dispersed phase in real time.

<u>Fig. 01*:</u> Results of replicated measurements on a 20 % o/w emulsion demonstrate that *in situ* particle size analysis highly reproducible.

Particle size was measured the with an ECA . In parallel, we prepared freeze fractured replicas of the samples and examined the specimens by TEM.

The results are shown in fig. 02 to 04:

INSITU PAT SENSOR TECHNOLOGY

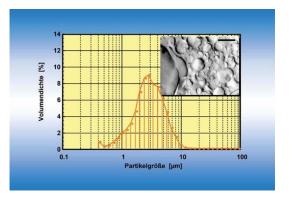

Fig. 02*: Volume distribution and corresponding TEM micrographs of o/w emulsions with 20, 40, 60, and 80 % oil content; bar: 5µm.

Emulsion Characteristic Analyser

For this experiment the ECA Sensor will directly insitu placed in undilluted original concentrated dispersed phase. For instance in a beaker or mini reactor for formulation of new products.

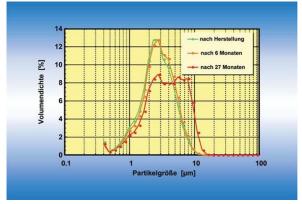

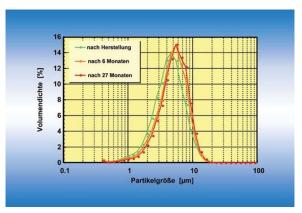

Emulsions with 20 % oil phase revealed the most shallow size distribution. By increasing the oil content the spread broadens and the mode of the distribution moves towards smaller values. 80 % emulsions gave almost the same particle size distribution as the 60 % emulsions. Only a small but reproducible peak in the size range from 50 to 80 μ m indicated the inhomogenity of this preparation. However, this is not sufficient for a quantitative characterization of the system.

Emulsion Characteristic Analyser

The measurement enables to monitor coalescence in 60 % emulsions as well as Ostwaldt ripening which occurs in 20 % emulsions.

From these results, we conclude that 3D ORM technology is able to in situ characterize emulsions with up to 60 % oil content. The method is sufficiently sensitive to monitor severe changes due to coalescence as well as to trace small changes produced by Ostwaldt ripening. Emulsions with 80 % oil could not quantitatively be characterized.

However, we must bear in mind that these emulsions are susceptible to dilution. Thus, reliable results can only be expected when the samples can be analyzed without extensive dilution. Thus, this challenging problem cannot be solved by currently existing methods. The results of the ORM-Measurement, however, can be taken as a fingerprint which is characteristic for this sample and allows to identify changes which occur during manufacturing or storing.

Emulsion Characteristic Analyser

Detecting with ECA - Sensor :

- Agglomeration of products,
- Stability of dispesphased systems,
- Dissolution processes of substances

No sample taken and preparation .

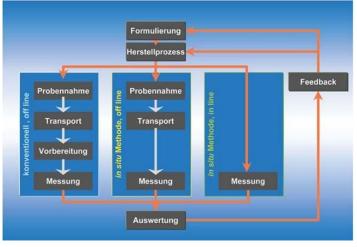

Fig. 07*: Comparison of the required steps for particle size analysis.

Mode of operation:

ECA- Sensor-technology based on Time of Flight Technology (TOF) and Optical back Reflection Measurement (ORM) and is a further development of the well known 3D ORM technology. Particles and droplets and their structures were detected and measured by a laser beam with higher energy as 3D ORM and with <10mW. At crossing the particles and droplets the laser beam detected their geometric expansion. This time periods in μ s will displayed in a statistic of all counted events.

Emulsion Characteristic Analyser

The patented measuring method of the optical visibility of the particles works in a band of wave length of 680 nm. So 300 nm will be the deepest detection limit for diffuse dispersphased systems. Clear dispersphased systems can also be detected with a laser power more than 10 mW.

Emulsion Characteristic Analyser

Dynamic insitu ECA - Sensor

Hardware			
Electronic	cabinet IP 44; optionally IP69		
	Data connection RJ 45 Bus		
	voltage 230V , when required 110 V		
Optical fiber	2 m cable between sensor and electronic		
Automation			
Software	SeQuip ORM–Software		
	Microsoft Windows 2000 and XP compatible without PC		

Installation and conditions		
Installation and Training	1 day at the customer	
Documentation	Manual in English available	
Requirements	Fitting of the in situ ECA Sensor:	
	Inline Sensor configuration for lab reactors	
	100 – 240 Volt AC; 5 Amai PS, earth cable needed	
	Electrical connection	
	Dust free environments with controlled temperature for the PC

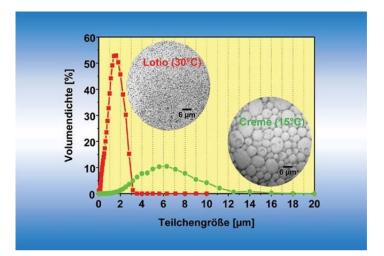

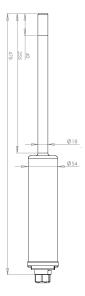

Fig. 14*: Volume distribution of a w/o type lotion and a o/ w cream which have identical composition and use both ethylcellulose as polymeric emulsifier but they were prepared at different temperatures (15 or 30 °C).

Emulsion Characteristic Analyser

	Specification
Material of the Sensors:	1,4571 (SS 316) for all parts which are in contact with the me- dium –other materials as required
	Electrochemical polished sapphire window at the sensor head optical grade: MIL– PRF-1383B 10-5
	Sealing: Hifluor – O-rings (other materials as required)
Max. operating pres-	Vacuum up to 3 bar, Optional 16 bar
sure: Working temperature	Plus 5°C - 85°C, optional minus 20 - 165°C
Installation	300 m – max. distance between measuring device and PC
	Max. 4 sensors, which can be connected with the PC
Validation	Option: Validation and 21 CFR Part 11
Software	Sequip ORM
Weight	15 kg (Sensor + Electronic)

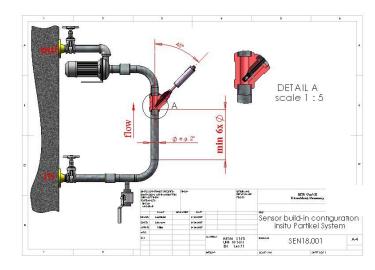

Fig. 15: By pass Installation of the sensors in a recirculation pipe
